

Customer Churn Risk Dashboard

EXECUTIVE SUMMARY

Customer churn is concentrated in specific customer segments rather than being evenly distributed across the customer base.

The objective is not to retain every customer at the same cost. The objective is to identify where retention action can create the greatest business impact.

RECOMMENDED APPROACH • Detect churn risk early • Identify the customer patterns associated with higher risk • Prioritize valuable at-risk customers • Apply targeted retention actions • Measure the outcome of those interventions

Churn Risk by Monthly Charges

Higher-risk charge segments should be investigated for pricing and value concerns, but charges should be treated as a risk signal—not a

Churn Risk vs Number of Services

Use service and support patterns as signals to identify customer-experience gaps and target engagement efforts more effectively.

Support & Security Adoption vs Churn Risk

Customers with different service levels show different churn-risk patterns. Higher-risk groups should be investigated for engagement, service adoption, and customer experience opportunities, with targeted retention actions rather than a one-size-fits-all approach.

Risk Distribution by Customer Value

Prioritize retention where customer value and churn risk overlap, focusing the strongest interventions on high-value customers with elevated risk.

Retention Opportunity by Risk

Focus retention resources where elevated churn risk represents significant potential customer-value exposure.

Retention Priority Matrix

Prioritize customers combining high churn risk with meaningful revenue and lifetime value

KEY MANAGEMENT OBSERVATIONS

- Churn is segment-specific: Different customer characteristics show different levels of churn risk.
- Risk should be addressed early: Preventive action is more valuable than reacting after churn occurs.
- Customer value matters: Retention resources should be concentrated where potential business impact is highest.
- Investigate before acting: High-risk segments should be analysed further to understand the underlying customer experience and service factors.
- Measure every intervention: Retention campaigns should be evaluated based on whether customer retention and value improve.

WHAT SHOULD WE DO?

- Prioritize: Focus on high-risk, high-value customers.
- Intervene early: Contact customers before risk becomes actual churn.
- Target: Design retention strategies for specific customer segments.
- Personalize: Match retention actions to customer value and risk.
- Measure: Track churn reduction and retained customer value after

WHAT SHOULD WE NOT DO?

- Do not treat every customer equally.
- Do not give expensive offers to every at-risk customer.
- Do not assume correlation means causation.
- Do not rely only on historical churn.
- Do not ignore customer value when allocating retention resources.

Continuous Improvement Loop

- PREDICT → PRIORITIZE → INTERVENE → MEASURE → IMPROVE
- Predict: Identify customers with elevated churn probability.
 - Prioritize: Combine churn risk with customer value.
 - Intervene: Apply the appropriate retention strategy.
 - Measure: Monitor customer retention and business impact.
 - Improve: Use the results to continuously refine the retention strategy.
